4 TYPES OF TRAININGS CAN BE DONE

First aid training is usually carried out in a well lit, carpeted classroom with plenty of space - how would your trainee or team members performed in a confined space or other difficult circumstances such as a road traffic collision or if the casualty was trapped by the legs! Would they even be expecting to carry out CPR outside of a classroom or pickup an amputated limb? This experience would certainly make them pause & ponder and would definitely test their readiness.

Imagine the outcome could be if you introduce this manikin into your routine training exercise.

Basic Life Support Training

- The manikin can be used for CPR and AED training. Chest compression can be performed with the bundled CPR Manikin. AED training can be performed with an optional AED trainer.

Immobilization Training

- Immobilization training can be performed with optional cervical collar, and other immobilization equipment.

Amputation Training

- The manikin has detachable arm and leg to simulate amputated limbs for trauma life support training.

Casualty Handling / Transfer Training

- The Full Body Manikin is ideally suited for casualty or patient handling and transportation training.
